Business Summary Report: Predictive Insights for Collections Strategy

1. Summary of Predictive Insights

Based on the exploratory data analysis (Task 1) and the predictive modeling plan (Task 2), several key patterns were identified in the dataset that help explain which customers are more likely to experience payment delinquency.

The analysis indicates that customers between 25 and 35 years old who have multiple missed payments and elevated credit utilization levels are more likely to fall behind on their credit obligations. In particular, individuals with three or more missed payments and credit utilization exceeding 55% show a noticeably higher probability of delinquency.

Another strong predictor identified during the analysis is the debt-to-income ratio. Customers whose debt-to-income ratio exceeds 0.45 tend to demonstrate higher levels of financial stress, which often leads to delayed or missed payments.

Key Insights Summary Table

Key Insight	Customer Segment	Influencing Variables	Potential Impact
Customers with high credit utilization and repeated missed payments demonstrate the greatest risk of delinquency.	Customers aged 25–35 with 3+ missed payments and credit utilization above 55%	Missed Payments, Credit Utilization, Age, Debt-to-Income Ratio	Targeted engagement with this segment could potentially reduce short-term delinquency by approximately 12%.

2. Recommendation Framework

Restated Insight

Customers between 25 and 35 years old who have three or more missed payments and credit utilization above 55% represent a high-risk group for future delinquency.

Proposed Recommendation

Implement a targeted digital reminder campaign using SMS and email notifications to encourage timely payments among these customers.

Specific:
Focus outreach efforts on customers aged 25–35 with a history of multiple missed payments and high credit utilization.

Measurable:
Monitor delinquency levels and aim to achieve at least a 12% reduction in 30-day delinquency rates within the targeted group.

Actionable:
Leverage the company's existing communication channels to send automated reminders, payment tips, and flexible repayment guidance.

Relevant:
This initiative directly supports Geldium's objective of improving repayment behavior and minimizing credit risk exposure.

Time-bound:
The outreach initiative will be conducted over a two-month campaign period.

Justification and Business Rationale

This approach focuses resources on a clearly identified high-risk customer segment where early intervention can make the greatest difference. By proactively reminding customers about upcoming payments and offering supportive communication, the organization can reduce delinquency while

maintaining positive relationships with customers. The campaign requires minimal infrastructure investment and can be scaled easily if the results prove effective.

3. Ethical and Responsible AI Considerations

When implementing predictive models for financial decision-making, it is important to consider ethical implications and ensure responsible use of data.

Potential Bias:
The model may unintentionally reflect biases present in historical data. For example, certain socioeconomic indicators such as income levels or geographic location could indirectly influence risk predictions. Regular fairness testing should be conducted to ensure that predictions do not disproportionately affect specific customer groups.

Explainability:
The selected logistic regression model allows analysts to clearly interpret how different variables contribute to delinquency risk. This transparency makes it easier for business stakeholders to understand and trust the model's recommendations.

Responsible Decision-Making:
Predictions generated by the model should support, rather than replace, human judgment. Collections teams should review high-risk classifications before initiating any customer intervention.

Additional Ethical Principles:
Customer privacy is protected by using anonymized data during analysis. Transparency in model design ensures that decision-making processes remain accountable, while continuous monitoring helps ensure that the model adapts to evolving customer behavior over time.
